

neutral term

<https://proofassistants.stackexchange.com/questions/1397/what-is-a-neutral-term>

A neutral term is a variable, or an eliminator stuck on a neutral term. Basically a stack of eliminators applied to a variable.

These terms are called *neutral*, and distinguished from other normal forms, because they have not reduced to a constructor, but they cannot reduce further (because the eliminators are stuck on a variable).
